

# ROBOTIC COMPANIONS FOR THE ELDERLY

- Companion robots provide targeted assistance for a variety of people, including older people, single children and people with mental and physical disabilities.
- To name a few examples of what robots are currently capable of:
  - They can simulate genuine interactions and companionship
  - Assess and monitor health using sensory technology
  - They can provide relief from social isolation.
- This topic is of relevance to the people of today and future generations, which is one of the main reasons we chose it. We are interested in researching where this idea could go as technology advances and the demand for companion robots increase.

## Roles:

Miracle: Team Project Manager, Researcher

Jack: Web Developer, Presenter, Researcher

Chenglin Yi: GitHub File Manager, Researcher
